# RootBeer Repository Report

     The figure above represents the activity done in the RootBeer repository source files. Source files included any file ending in '.java', '.cpp', '.kt', '.cpp', and '.h' as these were the most used program languages used in order from greatest to least. The points at the top show which files have been modified most recently and the bottom being the oldest. The colored dots represent unique authors who made these changes and from left to right are the unique identifiers for each file modified.

     From what we can see the blue and orange, Scott Alexander Brown and Matthew Rollings respectively, seem to only be the ones contributing to the repository in recent weeks. With their focus being on modifying files 0 - 10. If any further questions on the current functions of the rootbeer repository please contact one of these two contributors. You can find details on this report here https://github.com/GMcommits/CS472_Labs/tree/mine_repository/repo_mining.
